PERSONAL HEALTH INTELLIGENCE · LAB AGENT

Your whole health, read together. An agent that acts on it.

VitaCrypt reads DNA, labs, wearables, microbiome, check-ins and the air you breathe as one profile, checks every link against research, and its Lab Agent turns it into a plan that it follows up.

Paul Burg, solo founder · Early-stage MVP · Guided live demo on synthetic data

app.vitacrypt.xyz/demo · no sign-up, no password

Your health lives in a dozen apps. The patterns live between them.

Fragments

DNA in one report, labs in a PDF, sleep in a watch app. The air you breathe is in none of them.

Dashboards, not actions

Each app shows its own numbers. Nobody checks later whether what you changed worked.

Trust

Advice mixes studies with guesses and sales. And the 23andMe breach exposed 6.9 million people’s data.

Health AI today mostly **reads one source and explains it**. It does not read the whole person, and it does not come back.

02 · VITACRYPT: FOUR PILLARS, ONE PROFILE

Most tools do one of these. The value is how they compound.

Unified

DNA, labs, wearables, microbiome, check-ins, environment in one profile

Cited

Every link checked against PubMed and Europe PMC; no invented PMIDs

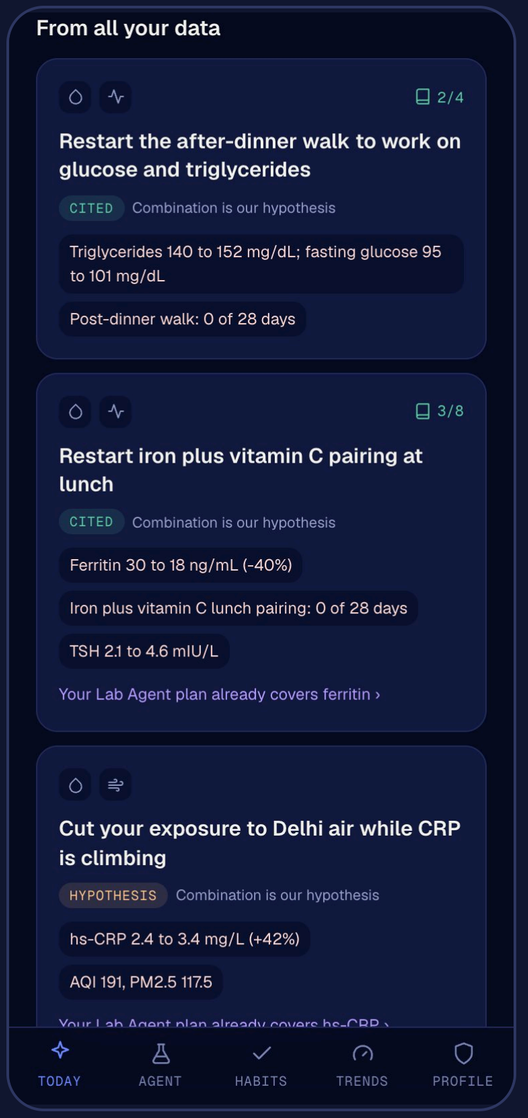

Personal

Your genes × your world: the same lab reads differently by genotype and air

Private

Minimized before anything leaves, encrypted per user, no single AI vendor

We have not found another product that reads all of these together.

Live app, fictional person, synthetic data · 03

03 · HOLISTIC, IN PRACTICE

Your genes × your world: three signals, one action

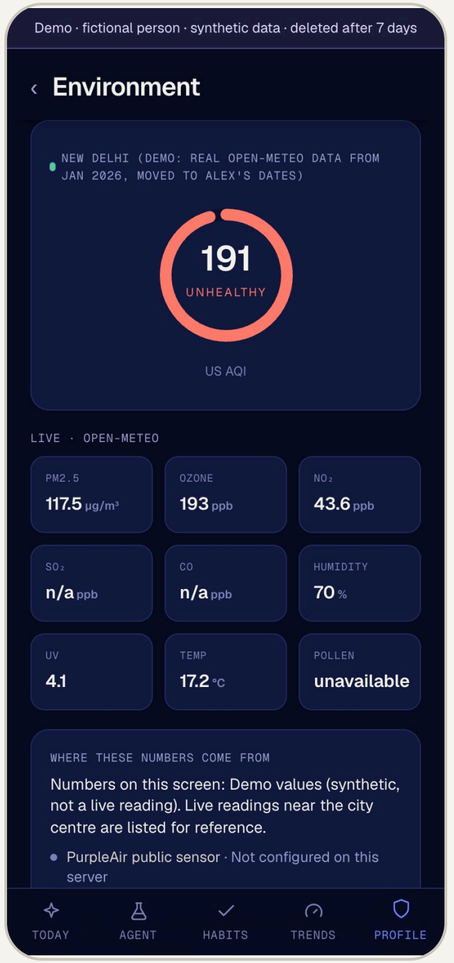

AIR · PM2.5 mean 125 µg/m³, 56 days

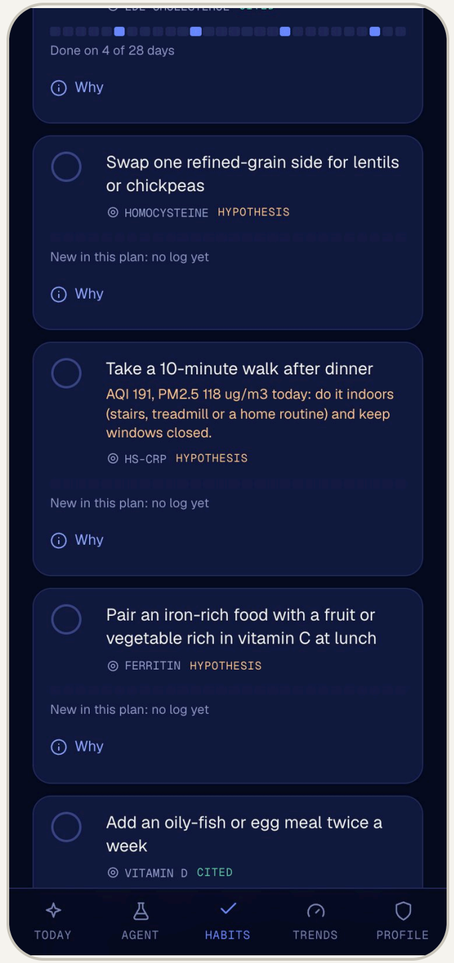

LAB · hs-CRP 1.6 to 2.1 mg/L

DNA · IL6 and TNF variants

“Watch inflammation in heavy-pollution months”, labelled Hypothesis: each link cited, the combination is ours.

Today’s air changes the plan: the walk habit becomes **“AQI 191: do it indoors”**.

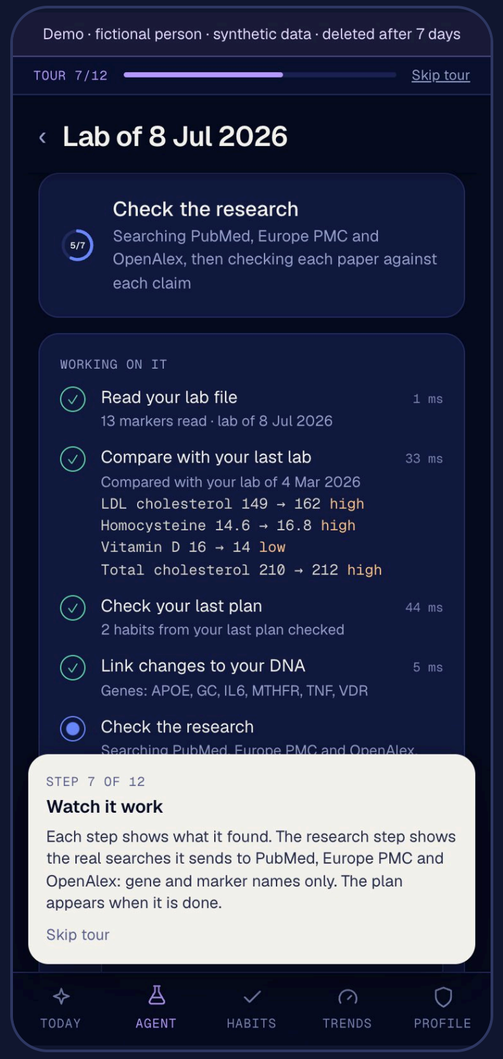

04 · THE LAB AGENT: THE PROFILE, IN ACTION

What makes it an agent

Definition	Lab Agent, as built
Goal	Bring out-of-range markers toward range, with no clinical advice
Decisions	Cited, Hypothesis or Ask your clinician; keep, swap or retire habits
Tools	Lab reader, DNA annotation, PubMed, Europe PMC, AI judge, maps
Actions	Habits, retest date, reminders, clinician link, lab order (sandbox)
Multi-step plan	Seven fixed steps per lab; a plan over weeks to the next lab
Other systems	Telegram, calendar, Junction (US sandbox), OpenStreetMap, Anthropic
Learns	Next lab vs its own plan and the habit log

No chat box. The visitor watches each step and the real search queries.

Live run with the guided tour, step 7 of 12 · 05

05 · DECISIONS YOU CAN CHECK

Every plan item is routed

Cited

Retrieved papers support it; PMIDs shown.

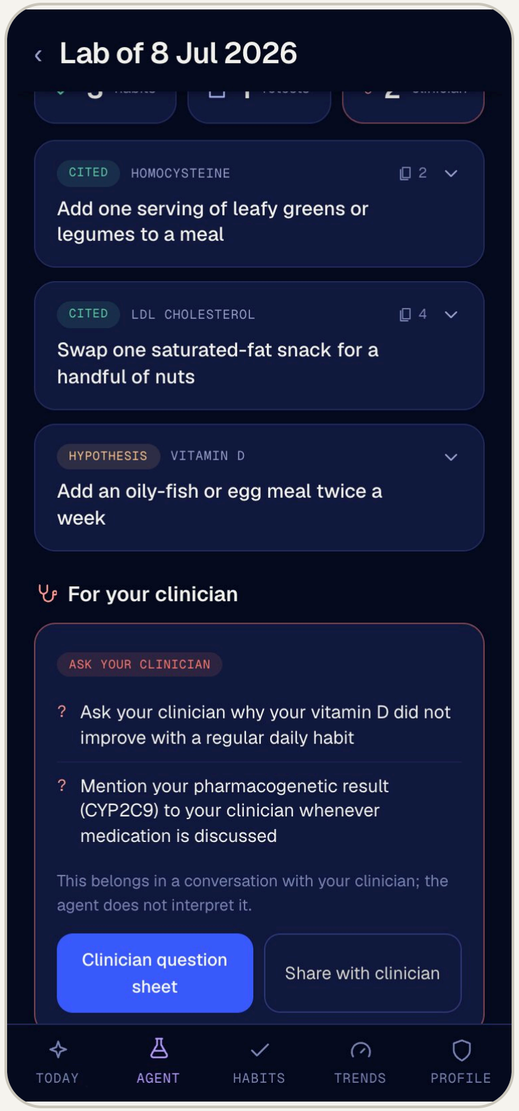

Hypothesis

Not confirmed by a cited study yet.

Ask your clinician

Clinical topics become neutral questions.

Reference, not prescription: supplements appear only as official values for adults with their source (NIH), never as a dose chosen for you. No diagnoses.

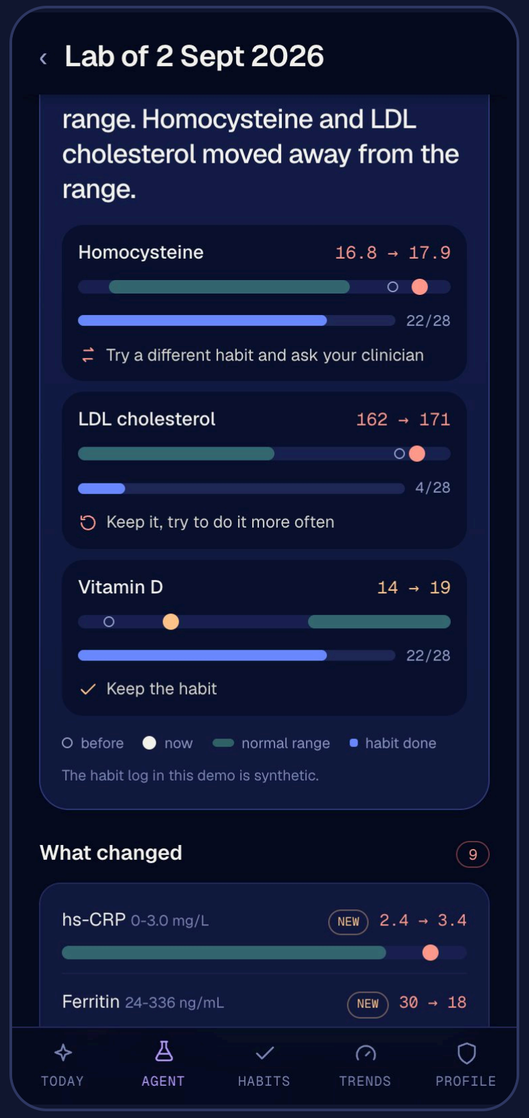

06 · LEARNS FROM RESULTS

On the next lab, the agent checks its own plan

Marker and habit log	Decision
Moved away, habit done 22 of 28 days	Swap the habit, ask the clinician
Moved away, habit done 4 of 28 days	Keep it, do it more often
Moved toward range	Keep the habit
Back in range	Retire the habit

Live run on the second demo lab: homocysteine 16.8 to 17.9 with the habit done on 22 of 28 days, so the agent swapped it and added a clinician question.

07 · ACTIONS IN THE REAL WORLD

Each action needs your tap and shows what will be shared

Retest reminders

Calendar file and Telegram reminders

Share with clinician

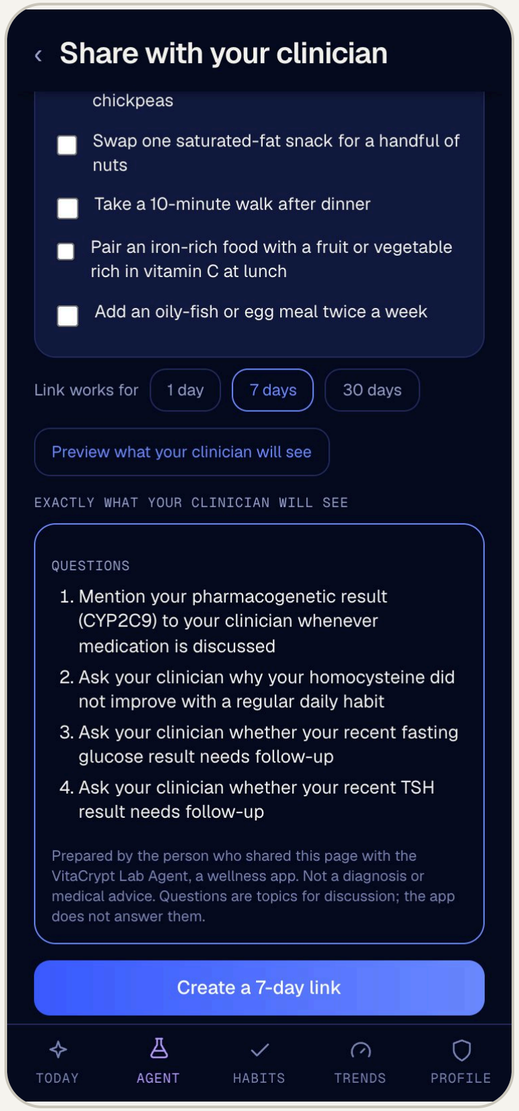

Private page, no name, 1 to 30 days, withdraw any time

Order the same tests

Junction lab-ordering sandbox, US only; simulated in the demo

Labs near you

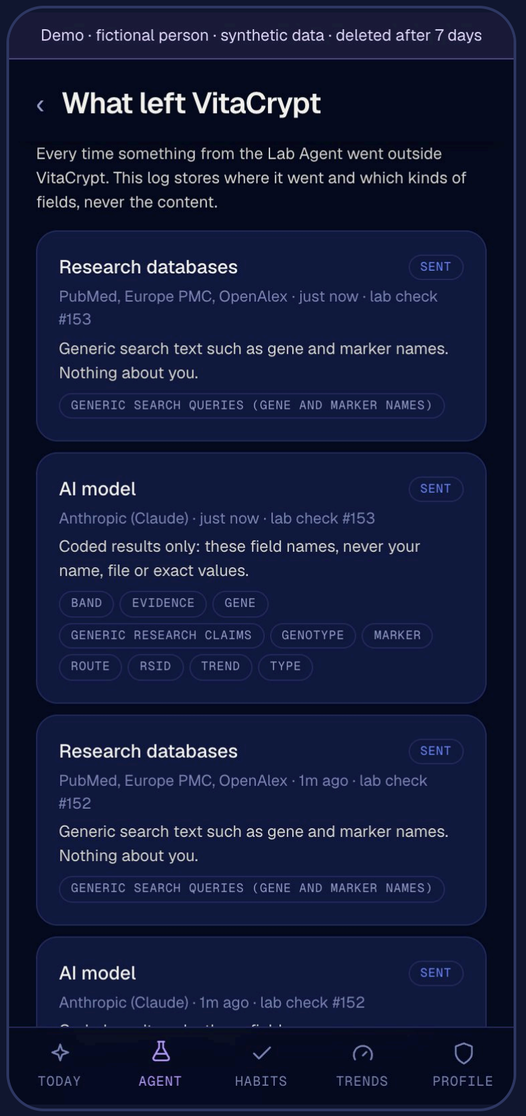

OpenStreetMap search by city, nothing about your health

Leakage is prevented by design, and logged

- **Coded minimum to the model:** marker band, trend, gene code. Never name, email, file or exact values
- **Search queries** carry gene and marker names only
- **Logs carry no content:** step, time, status
- **Encrypted at rest** with a per-user key held by our server; we do not claim more
- **Delete destroys the key** (crypto-shred)
- **File text never triggers tools;** the tool set is fixed in code
- **What left VitaCrypt:** every destination and field type, never the content

Demo: fictional person, private copy deleted after 7 days, uploads off, outbound simulated.

09 · WHY VITACRYPT

Others see one source. VitaCrypt reads the whole person, and follows up.

What matters	Typical health AI today	VitaCrypt
Whole person	One source at a time	**DNA, labs, wearables, microbiome, check-ins, air together**
Personal	Rarely combines genotype with environment	**Your genotype × your local air and climate**
Evidence	Answers without a label per claim	**Each item Cited (PMIDs) or Hypothesis; no invented PMIDs**
Follow-up	Explains a report when asked	**An agent that checks its own plan at the next lab**
Action	Read only, or inside one clinic network	**Reminders, clinician link, lab order, each after a tap**
Safety	Varies by product	**No diagnoses, no personal doses; clinician questions**
Privacy	Full records shared with the assistant	**Coded fields only; every outbound logged**
Incentive	Some sell supplements or own services	**No supplement sales, no affiliate fees**

Typical: Amazon Health AI, ChatGPT, Claude, Copilot, Function, Vita App; public pages, Oct 2026 · 10

Cheap to run, priced on follow-up

~$0.02
per agent run, measured (2 model calls)

$0.02-0.06
model cost per active user per month, estimate

$30-60
per month infrastructure today, one server

- **Subscription** for individuals; price tested in the founder and closed beta
- **Pay per call** for other AI agents via MCP + x402 (roadmap)
- **Partner labs and clinics** receive orders and sheets the user approves

From live demo to real labs

Next	What
Founder beta	Paul’s own labs: local lab formats, units, manual correction before a run
Production privacy	Zero-retention model terms, keys held by the user
Bring your own agent	Lab Agent as an MCP server; x402 pay per call
UAE	Partner integration with labs and clinics, roadmap, after legal review

Team

Paul Burg, solo founder. Designed and built VitaCrypt alone: platform, Lab Agent, live demo. Environmental science: M.Sc., PhD coursework (ABD) in Sustainable Development. Founder of his own ventures since 2011.

Ask

Technical mentorship, UAE lab and clinic partners, a hard review of our safety claims.
